

# Business activity index

July 2023

**In July, business activity slowed down slightly, but the indicator remained in the positive area, amounting to 50.7.**

Graph 1. Dynamics of business activity index (BAI)\*

\* A value of the indicator above level 50 means a positive change, below level 50 - a negative. The further (higher or lower) the index value is from the 50 level, the higher the rate of change (increase or decrease) of the indicator.

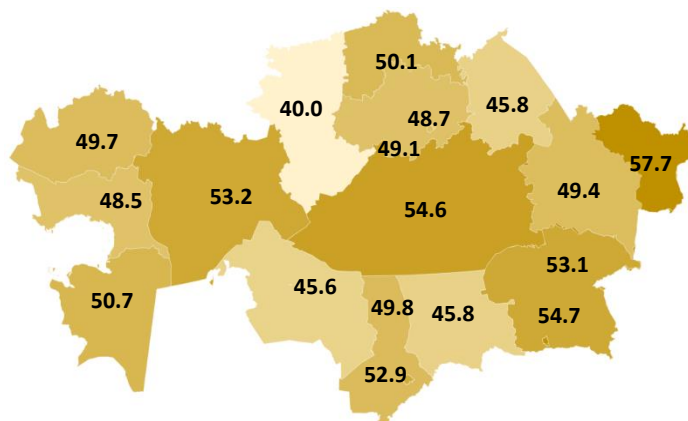

## The business activity index in July 2023 decreased to 50.7.

The improvement was noted in the service and manufacturing sectors, where the indices were in the growth area, amounting to **51.5** and **50.1**, respectively. In the service sector, there was an improvement in all components except delivery times, in production an improvement in the level of employment and in the volume of new orders was noted. In the mining industry, the index again moved into a negative area (**48.8**) due to a decrease in the volume of inventories and new products. In construction, the indicator improved to **49.2** (from 47.8 in June), but the longer delivery times and the volume of new orders restrain the activity of construction companies.

Graph 2. BAI in July by regions

**Business activity improved in 8 regions, worsened in 10 regions.**

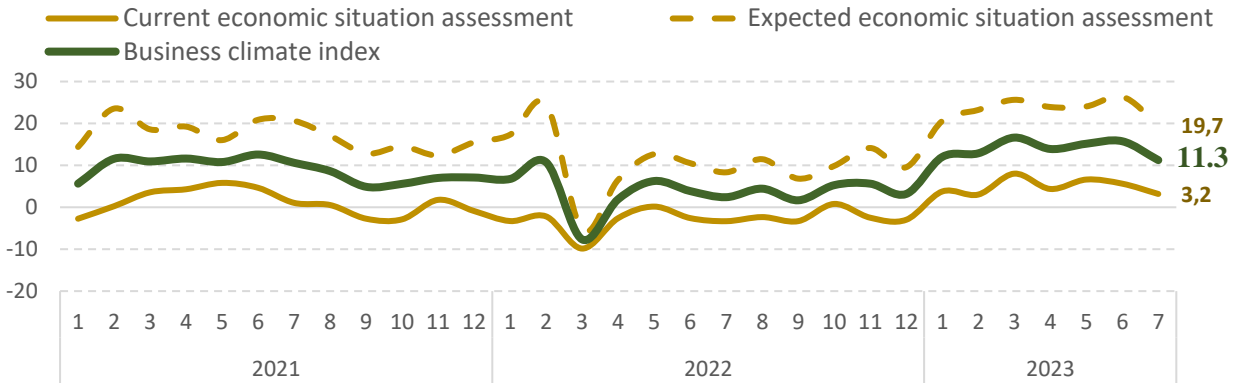

The highest index value was recorded in East Kazakhstan region (57.7), the lowest - in Kostanay region (40.0).

# Business climate index

**The business climate index has declined, but the indicator remains positive. Estimates of both current and future business conditions have decreased.**

Graph 3. Dynamics of business climate index (BCI)\*

\* To assess current and future business conditions, a balance of responses (BO) is used, which is calculated as the difference between the shares of positive and negative answers to questions about changes in business conditions. An index value above 0 indicates an improvement, below 0 indicates a deterioration of the situation.

## The demand for finished goods/services of enterprises has noticeably improved.

The change in access to communications was also positively assessed. For other factors of business conditions (tax burden, access to finance/loans, business protection issues) negative assessments prevail.

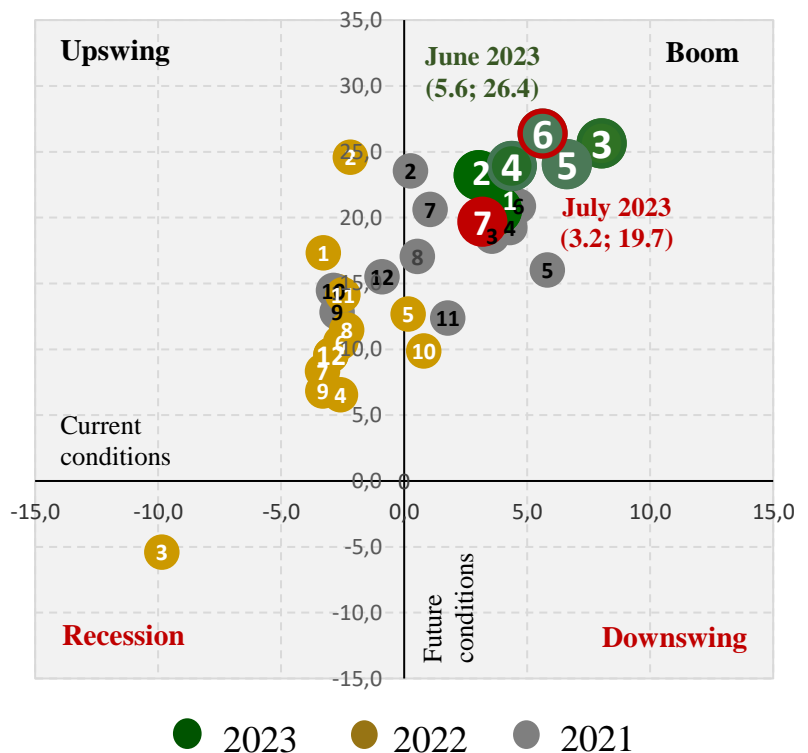

**In July 2023, the business cycle "clock" indicator remained in the boom area.**

Enterprises' assessment of current business conditions was to 3.2

The assessment of future business conditions for the next 6 months decreased to 19.7.

\* Business cycle clock is developed by Ifo institute demonstrates in which phase of the cycle the economy was in a certain period. To construct it the series of current conditions (X axis) and future conditions (Y axis) assessments are used.

## METHODOLOGICAL COMMENT

---

<sup>1</sup> The information was prepared based on the results of monthly survey of enterprises participating in the monitoring of the real sector.

<sup>2</sup> The business activity index is calculated as an aggregated change in such indicators of enterprises as the volume of new orders, the level of employment, the volume of new products, the volume of inventories, delivery times.

<sup>3</sup> To calculate the Business Activity Index, the diffusion index (DI) is used, which is calculated as the sum of positive responses and half of the responses unchanged. This index is a generalized indicator characterizing the dynamics of changes in the indicator.

<sup>4</sup> To calculate the business climate index (BCI), according to the methodology of the Ifo Institute, a balance of answers (BA) on indicators of business conditions in the current month (SIT) and expected changes in business conditions in the next 6 months (EXP) is used:

$$BCI^* = \sqrt{(BA(SIT) + 200) * (BA(EXP) + 200)} - 200$$

where, BA – balance of answers

SIT – current economic condition

EXP – expected economic condition

<sup>5</sup> The BA (balance of answers) is calculated as the difference between the shares of positive and negative responses to questions about changing business conditions. Enterprises choose one of the three suggested answers "improved", "have not changed" and "worsened". The response shares are calculated using weights.

<sup>6</sup> The business cycle clock, developed by the Ifo Research Institute, is a diagram (coordinate system) divided into four quadrants using the crosshair of two zero lines, which from the point of view of the business situation refer to the four stages of the economic cycle: upswing, expansion, downswing, recession. If the assessment of current conditions is negative and expectations are positive, the economy is in the upswing area, if both the assessment of current conditions and expectations are positive, then the economy is in the expansion phase, etc.

<sup>7</sup> The data in the diagrams are seasonally adjusted (except for the assessment of future conditions and the assessment of factors).

<sup>8</sup> Changes are possible in the previous months dynamics due to seasonal clearing and GVA adjustment.

<sup>9</sup> Detailed information by sector (information about the sample, the dynamics of indicators, the results of the distribution of responses) is presented in the dashboard.

<sup>10</sup> As the representativeness of the sample by region by sector is achieved, the calculation results will be presented in accordance with the new administrative-territorial structure.
